

Go mobile with enterprise data and processes – secure, simple and comfortable

Brief, decide and act – everywhere and any time

Your employees are on the road all the time? As field representative, consultant, customer service employee, sales assistant or in logistics and transportation? You need on-site access to the enterprise software? Access to order data, current sales figures, customer addresses or the present liquidity status?

Tablets such as iPad, Galaxy Tab and Playbook but also Android, Apple, BlackBerry or Windows Smartphones offer you much more than communicating and mobile surfing the Internet.

cobago All-in-One is the universal mobile application platform for your enterprise data when you are on the road. Brief, decide and act whenever and wherever you want – but always on the basis of current data. **cobago All-in-One** makes your enterprise software mobile, keeps your Intranet data secure and confidential at all times and provides you with the license to act – wherever you have access to the web.

All-in-One

cobago All-in-One is a mobile enterprise application platform connecting Tablets, Smartphones and Notebooks/PCs with your existing enterprise software.

The All-in-One Mobility Server connects standards software, business solution software and individual software with mobile devices.

The All-in-One-App provides integrated functional packages on these devices for closed user groups.

The outcome: Your most important enterprise data and processes are available to you whenever and wherever you want – always secure, red-hot and online while on the go. Your work will be more efficient and relaxing and you simply gain more time for the really important things.

Mobility Server

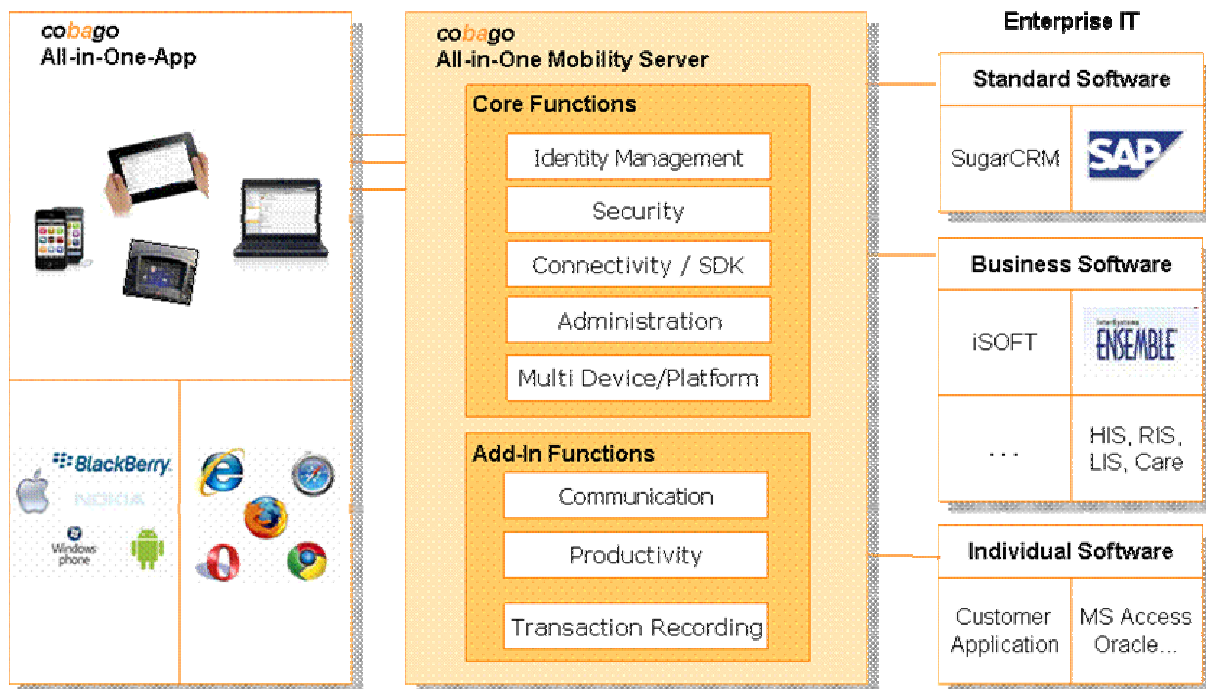

The **cobago All-in-One Mobility Server**, a virtual machine on one of your server systems, protected and behind a firewall, implements the central functions of every cobago solution:

The **Connectivity SDK** includes an open documented interface for mobile access to your enterprise software, instructive usage examples, a collection of icons and connector sockets for the seamless integration of connectors.

The **GUI Designer** for your own individual user interface will soon complete the Software Development Kit.

The **Security Functions** include a 3-Component Login, Bruteforce Attack Filter, SSL/https, Intrusion Prevention by means of a separate Presentation Manager as well as the option of an individual mobile subnet with your own APN. Data is prepared and presented “on demand” through the server. Confidential information is at no time permanently stored on mobile devices.

The **Identity Management** supports an autonomous, mobile user ecosystem and enables direct as well as transitive access to enterprise data. Connects to LDAP or Active Directory are provided on request.

cobago All-in-One architecture
(here with healthcare business examples)

By means of the **Admin Functions**, closed user groups are centrally defined, their individual choice of functions is orchestrated, the connectors are linked, the users are activated/deactivated and the licenses are managed.

The **Multi Device Function** supports and separately handles a broad multiplicity of mobile devices and operating systems, e.g. iPhone/iPad or iPod with iOS, Tablets and Smartphones with Android, BlackBerry or Symbian operating systems and the leading browsers using Windows, Linux or Mac OS.

Connectors

Connectors close the gap between Mobility Server and enterprise application.

Realised with the preferred technology used in your enterprise (Java, .NET, PHP or every other modern programming language), Connectors mobilize and integrate data from any existing standard software, business solution and individual software and use the cobago API for display on the respective device.

With the corresponding connector, existing enterprise software packages such as, for example,

- Mobile forms and tables
- CRM and Customer Care Systems
- Order and deployment planning
- Enterprise Resource Management
- Workflow, IT and System Management
- SQL Databases
- Integration- / Communication servers
- Individual Software

can be used on all devices quickly and easily, no matter whether mobile or stationary, with keypad or touch-screen, large or small.

Contact your trusted system provider or cobago systems directly for the tailor-made connector to your enterprise software.

All-in-One-App

The **All-in-One App** with its elegant touch-optimized user interface takes your data and processes to the mobile device, where data is never stored permanently but is only visualised screen-by-screen.

During this process, mobile data from different enterprise sources is integrated into one single application and is uniformly displayed - all in one. Depending on the device, a virtual or a native App is provided:

The All-in-One **Native App** visualises mobilised data and processes on Apples' iPhone, iPod touch and iPad. The App is simply downloaded and installed from the iTunes Store and is upwards compatible with all current and future standard and additional functions of cobago. The performance optimized SOA protocol guarantees a high degree of security and confidentiality for communication and interaction with central components.

The All-in-One **Web App** is the browser-based visualisation component for all devices supported by cobago. AppStores and downloads are not required. The cobago Mobility Server identifies the device used and displays the delivered data in an ideal way.

All-in-One Pro

All-in-One Pro, a package with optional additional functions for the Mobility Server, offers an appealing Web 2.0 communication, just as you know it from chats, microblogs and Twitter on the public web – with restricted access for your entire Intranet. Mobile Productivity Functions and Transaction Recording for monitoring and billing purposes make the Pro package complete. Individual modules include CallManager (routing of calls, callback), Agenda (To-Do list), Chat (with Email-Gateway), Infoboard (bulletin board) and Biztweet (office twitter), team (members), Presence, Favourites and Skillsearch as well as Activity and Phone status.

Advantages for the Enterprise

The All-in-One concept offers extensive advantages for the user of the mobile data solution in the enterprise:

Mobile Compliance: A clearly outlined scope of functions is centrally defined, managed, controlled and furnished on every device in a secure mobile ecosystem – even on employees' private Smartphones (BYOD).

Mobile Licensing: The licensing model distinguishes between the local „full user“ and mobile users, and takes account of the particularities of mobility.

Mobile Security and Confidentiality: There is no data stored on the device. Data cannot get lost in case of a theft or loss of the device. Even the provider of the device has no access to the data.

Quick and easy

The cobago Out-of-the-Box solution can be easily integrated in the overall Intranet concept of your enterprise. Changes to enterprise applications are not required.

Connectors link the applications' open API to the Mobility Server. As soon as the mobilizable data and functionality is defined, the connector customization, based on sample code of the SDK, may be carried out in virtually no time.

In most cases this customization / implementation only takes a couple of days and can even be carried out with moderate IT knowhow. When required, your system provider or cobago will be pleased to give you advisory assistance.

Multi Purpose

cobago All-in-One is used everywhere where efficient mobile collaboration and effective interaction is of particular importance. For example: for decision-makers, field representatives and backoffice, sales, logistics and mobile production.

In Health and Care, Energy and Mineral Oil Management, Chemistry and Pharmaceuticals business but also in the field of „actively mobile“ medium-sized companies in Construction, Facility Management, Tourism, Media, for consultants, attorneys and experts, in outlets, at exhibitions and events and with public authorities involved in field operations.

Multi Platform

cobago All-in-One works on all leading smartphone types and mobile operating systems, such as iPhone, Android Smartphones, BlackBerry and Windows Mobile. The touch-optimised App is optimized for browsers. It runs on PC browsers using Windows, Linux or Mac OS and can be integrated into Outlook on the PC.

Calculable costs

A cobago All-in-One license package includes the Mobility Server, mobile users, connections to standard software, business solution and individual software as well as the optional Pro package. It can be used per software license at a **one time royalty** plus maintenance or based on a **monthly usage fee**, then including maintenance.

Depending on the mobile operator, contract and configuration additional costs may be incurred for the mobile data transmission.

More information

For more information on cobago All-in-One, integration of your particular IT environment, connectors for your standard software or business software as well as about the specific security options of cobago All-in-One in your mobile Intranet please contact:
